DETAILED ACTION

Claims 1-25 are presented for examination.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1-25 are rejected under 35 U.S.C. 103(a) as being

unpatentable over over Decker et al (Clin. Cancer Res. 5:1169-1192 (1999)) in view of Corominas et al (J. Biol. Chem. 260(30):16269-16273 (1985)) and Armstrong et al (Anal. Biochem. 292:26-33 (2001)).

Decker discloses a PARP inhibition assay which differs from that recited in the claims in that Decker does not use fluorescently labeled NAD in the quantification of enzyme activity. See, e.g., Fig 1, on page 1170. However, Corominas clearly discloses that labeled NAD can be used in the quantification of PARP activity. See, e.g., page 16270, left column. Moreover, Armstrong discloses the use of fluorescently labeled NAD in an assay of ADP-ribosylating enzyme, an assay which detects similar activity to that of both Decker and Corominas. See, e.g., page 28. Thus, the artisan of ordinary skill would have considered it obvious to have used fluorescently labeled NAD in the quantification of enzyme activity in Decker's assay, motivation for such practice being derived from Corominas' disclosure of the suitability of labeled NAD as detection moiety in PARP assays, and from Armstrong's disclosure of the suitability of fluorescently labeled NAD as a detection moiety in a similar assay of ADP-ribosylating enzyme. Moreover, the selection of known fluorescent moieties, and the determination of suitable linking moieties therefor as recited

in the claims under examination, would have been considered obvious in view of the cited references' disclosures of the suitability of using fluorescently labels to detect NAD. A holding of obviousness is therefore required.

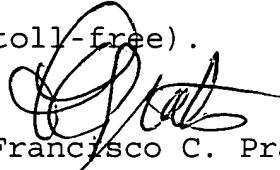

No claims are allowed.
